

NOKIA
CONNECTING PEOPLE

**Connecting securely
for absolute
peace of mind**

**Be Assured
Be Relaxed
Be In-Control**

In Fact, Take a Moment Just to Be

True relaxation is a goal long sought. Peace and tranquillity are hard to find in any aspect of life - and even more so in the hectic business climate in which we must live. To help you achieve this goal, click [HERE](#), grab a coffee and take just twenty minutes to read "**At the Heart of Financial Services**" - the latest IDC white paper on the major requirements and security concerns in the industry today.

Technology dramatically changes the way customers conduct business with financial organizations, and the sector is driven by customer concerns over security, by government regulation and the need to decrease operational risk. The potential of ebanking will only be realised if the customer has the same peace of mind about online services as they do about 'bricks and mortar' ones.

The financial services industry will therefore rely even more heavily on technology, and on the security of their online transactions. There will be a need to provide security management, access control, authentication, virus protection, encryption, intrusion detection, vulnerability assessment and perimeter defence.

In this world of finance, with integrity as its cornerstone, the need to significantly increase adoption and implementation of security policies whilst somehow still managing to develop new business opportunities, leads to challenges which weigh heavier and heavier.

If you have a desire for relaxation and tranquillity - and if we have sparked your interest - register on-line for our "Security in Finance" workshop at . . .
